

Cancer of the Ureter

Cancer of the ureter begins in the cells that line the inside of the tubes (ureters) that connect your kidneys to your bladder. Ureters are part of the urinary tract, and they carry urine produced by the kidneys to the bladder.

Cancer of the ureter is uncommon. It occurs most often in older adults and in people who have previously been treated for bladder cancer.

Investigations:

Contrast CT Scan

Treatment:

Treatment for cancer of the ureter most often involves surgical removal of entire ureter along with the kidneys. In certain cases, chemotherapy may be recommended.
